Fixture study title

Fixture exact full author name(s)
Fixture exact affiliation(s)

Fixture fixed month and year

Abstract

Fixture problem, system built, study question, design and evidence-supported answer. State the reporting unit, population and main limitation. Do not insert example results.

1 Introduction

Fixture problem, why it matters, contributions and scope.

2 Design and system under test

Fixture explain what was built and why. Include the key design visuals and their provenance.

3 Related work

Fixture cite verified sources and explain the comparison, rather than listing references.

4 Research question and prior decision rules

Fixture reproduce rules fixed before the run, with a dated source. Label later decisions exploratory.

5 Harness and apparatus

Fixture describe the implementation, versions, execution environment and checks.

6 Methods

Fixture population, inclusion/exclusion rules, sample unit, repeated measures, labels, uncertainty, analysis plan, missingness, costs and latency definitions.

7 Results

This is a software fixture, not a scientific study.[1] Fixture write from the extracted evidence ledger. Report counts with denominators and units.

8 Discussion

Fixture explain what the evidence means and distinguish interpretation from measurement.

9 Limitations

Fixture negative findings, uncertainty, bias, generalizability and unmeasured quantities.

10 Conclusion

Fixture answer the question within the measured scope.

Data and code availability

Fixture verified release locations, versions, licences and restrictions. Do not promise a release that has not happened.

Use of AI tools

Fixture describe significant AI assistance actually used (for example code, experiments, analysis, synthetic labels/data, figures or drafting), with relevant tool/version details. Record human review accurately. Do not state that authors approved the paper before they have.

References
